Clinical Narrative

The patient, a 58-year-old male with a history of hypertension, presents with sudden onset of facial drooping, slurred speech, and weakness in the right arm, which began approximately 20 minutes ago. These symptoms raise concern for a possible stroke. The patient's medical history includes hypertension, and he is currently taking Lisinopril. There are no known allergies to medications other than Penicillin. Recent lab results show elevated cholesterol levels.

Differential Diagnoses

Rank	Diagnosis	ICD10	Probability
1	Acute Ischemic Stroke	I63.9	VERY-HIGH
2	Transient Ischemic Attack (TIA)	G45.9	MODERATE

3	Intracerebral Hemorrhage	I61.9	LOW-MODERATE
---	--------------------------	-------	--------------

Information Gaps

- Neurological examination findings
- Brain imaging results (CT/MRI)
- Vital signs

Recommended Next Steps

- Immediate neurological assessment
- Urgent brain imaging (CT/MRI) to rule out hemorrhage
- Monitor vital signs and neurological status
- Consider thrombolytic therapy if ischemic stroke is confirmed and within treatment window
